①  $W$  is subspace of  $\mathbb{R}[x]$  : it contains zero vector, closed under addition, closed under scalar multiplication.

$$- W := \{ a_0 + a_1x + a_2x^2 : a_0, a_1, a_2 \in \mathbb{R} \} \subseteq \mathbb{R}[x]$$

$0 + 0x + 0x^2 = 0 \in W$ , therefore zero vector is satisfied.  
*these are the same set.*

$$- \text{let } v := \{ b_0 + b_1x + b_2x^2 : b_0, b_1, b_2 \in \mathbb{R} \} \subseteq \mathbb{R}[x]$$

$$b_0, b_1, b_2 \in \mathbb{R}$$

we can now do this:  $(a_0 + a_1x + a_2x^2) + (b_0 + b_1x + b_2x^2)$

$$\Rightarrow (a_0 + b_0) + (a_1 + b_1)x + (a_2 + b_2)x^2, \text{ this results in a polynomial}$$

$(c_0 + c_1x + c_2x^2)$ , with  $c_0, c_1, c_2 \in \mathbb{R}$ , therefore  $W$  is closed under addition.

Now let  $c$  be a scalar,  $c \in \mathbb{R}$  and  $(a_0 + a_1x + a_2x^2) \in W$

$$c(a_0 + a_1x + a_2x^2) = ca_0 + (ca_1)x + (ca_2)x^2$$

this results in a polynomial with real coefficients.

Therefore,  $W$  is closed under scalar multiplication.

Therefore,  $W$  contains the zero vector, it's closed under addition, and is closed under scalar multiplication.

7/10

b) Prove  $\{x^2, (x-1)^2, (x-2)^2\}$  is basis of  $W$

$$x^2$$

$$(x-1)^2 = (x-1)(x-1) = x^2 - x - x + 1 = x^2 - 2x + 1$$

$$(x-2)^2 = (x-2)(x-2) = x^2 - 2x - 2x + 4 = x^2 - 4x + 4$$

Check if  $W$  can be written as linear combination using these functions.

$$a_0 + a_1x + a_2x^2$$

$$c_1x^2 + c_2(x-1)^2 + c_3(x-2)^2 = c_1x^2 + c_2(x^2 - 2x + 1) + c_3(x^2 - 4x + 4)$$

$$\Rightarrow (c_1x^2 + c_2x^2 + 2c_2x + c_2 + c_3x^2 - 4c_3x + 4c_3)$$

$$(c_1 + c_2 + c_3)x^2 + (-2c_2 - 4c_3)x + (c_2 + 4c_3)$$

$$c_1 + c_2 + c_3 = a_2$$

$$-2c_2 - 4c_3 = a_1$$

$$c_2 + 4c_3 = a_0$$

System has unique solution  $(a_0, a_1, a_2)$ , the given set spans  $W$ .  
 ? Needs more justification  
 check their independence.

$$(c_1 + c_2 + c_3)x^2 + (-2c_2 - 4c_3)x + (c_2 + 4c_3) = 0$$

$$c_1 + c_2 + c_3 = 0$$

$$-2c_2 + 4c_3 = 0$$

$$+ 2c_2 + 8c_3 = 0$$

$$c_1 = 0$$

$$\cancel{c_2 + 4c_3}$$

$$-2c_2 - 4c_3 = 0$$

$$12c_3 = 0$$

$$c_3 = 0$$

$$c_2 + 4c_3 = 0$$

$$c_2 + 4(0) = 0$$

$$c_2 = 0$$

Since set is linearly independent and spans  $W$ , it is basis of  $W$ .

Not a clear logical explanation of why something is true. Looks like scratch work.

Since  $c_1 = c_2 = c_3 = 0$ , it shows linear independence.

6/10

let  $B = (x^2, (x-1)^2, (x-2)^2)$ , and compute  $[(x+1)^2]_B$

$$(x+1)(x+1) = x^2 + x + x + 1 = x^2 + 2x + 1$$

$$(x+1)^2 = \cancel{x^2} (x+1)(x+1) = \cancel{x^2 + x + x + 1} = x^2 + 2x + 1$$

$$c_1 x^2 + c_2 (x-1)^2 + c_3 (x-2)^2$$

$$(x-1)^2 = (x-1)(x-1) = x^2 - x - x + 1 = x^2 - 2x + 1$$

$$(x-2)^2 = (x-2)(x-2) = x^2 - 2x - 2x + 4 = x^2 - 4x + 4$$

$$x^2 + 2x + 1 = c_1 x^2 + c_2 (x^2 - 2x + 1) + c_3 (x^2 - 4x + 4)$$

$$x^2 + 2x + 1 = (c_1 x^2 + c_2 x^2 - 2c_2 x + c_2 + c_3 x^2 - 4c_3 x + 4c_3)$$

$$= (c_1 + c_2 + c_3)x^2 + (-2c_2 - 4c_3)x + (c_2 + 4c_3)$$

$$c_1 + c_2 + c_3 = 1$$

$$-2c_2 - 4c_3 = 2$$

$$-2c_2 + 8c_3 = 2$$

$$-2c_2 - 4c_3 = 2$$

$$c_2 + 4c_3 = 1$$

$$4c_3 = 4$$

$$c_3 = 1$$

$$c_2 + 4 = 1$$

$$c_2 = -3$$

$$c_1 - 3 + 1 = 1$$

$$c_1 = 3$$

Therefore,  $[(x+1)^2]_B = \begin{bmatrix} 3 \\ -3 \\ 1 \end{bmatrix}$  | 0 || 0

d) Let  $(= (1, x, x^2))$ , which is usually the most convenient choice of basis matrix  $P_{B,C}$

$$B = (x^2, (x-1)^2, (x-2)^2)$$

$$a_0 + a_1x + a_2x^2$$

$$x^2 = 0 + 0x + 1x^2$$

coordinate vector:  $\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$

$$(x-1)^2 = (x-1)(x-1) = x^2 - x - x + 1 = x^2 - 2x + 1$$

coordinate vector:  $\begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix}$

$$(x-2)^2 = (x-2)(x-2) = x^2 - 2x - 2x + 4 = x^2 - 4x + 4$$

coordinate vector:  $\begin{bmatrix} 4 \\ -4 \\ 1 \end{bmatrix}$

$$P_{B,C} = \begin{bmatrix} 0 & 1 & 4 \\ 0 & -2 & -4 \\ 1 & 1 & 1 \end{bmatrix}$$

? 6/10

(e)  $\underline{[(x+1)^2]}_C$

$$(x+1)^2 = x^2 + 2x + 1$$

$$[(x+1)^2]_C = \begin{bmatrix} \frac{1}{2} \\ 1 \\ 1 \end{bmatrix}$$

$$P_{B,C} = \begin{bmatrix} 0 & 1 & 4 \\ 0 & -2 & -4 \\ 1 & 1 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 1 & 4 \\ 0 & -2 & -4 \\ 1 & 1 & 1 \end{bmatrix}_{3 \times 3} \begin{bmatrix} \frac{3}{2} \\ -3 \\ 1 \end{bmatrix}_{3 \times 1} = \begin{bmatrix} 0(3) + 1(-3) + 4(1) \\ 0(3) - 2(-3) - 4(1) \\ 3 - 3 + 1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

(identity holds)

$$A, X \in F^{n \times n}$$

$$\text{let } B_A(X) = A \times A, \text{ Is } B_A \text{ linear?}$$

check for:

$$B_A(X+Y) = B_A(X) + B_A(Y)$$

$$B_A(cX) = c B_A(X)$$

$$\text{let } X, Y \in F^{n \times n}$$

$$c \text{ is scalar} \in F$$

$$B_A(X+Y) = A(X+Y)A = A \times A + A \times A = B_A(X) + B_A(Y)$$

additivity is satisfied.

$$B_A(cX) = A(cX)A = c(A \times A) = c B_A(X)$$

homogeneity is satisfied

since, additivity and homogeneity is satisfied,  $B_A$  is linear  $\times$

10/10

$$\textcircled{2} \text{ For } A, X \in F^{n \times n} \text{ let } f_X(A) = A \times A. \text{ Is } f_X \text{ linear?}$$

$$\text{check for: } f_X(A+B) = f_X(A) + f_X(B)$$

$$f_X(cA) = c f_X(A)$$

$$f_X(A+B) = (A+B) \times (A+B) = A \times A + A \times B + B \times A + B \times B$$

~~X~~ not equal

to  $f_X(A) + f_X(B)$  No additivity

$$f_X(cA) = (cA) \times (cA) = cA \times cA = c^2 A \times A = c^2 f_X(A)$$

$$c^2 f_X(A) \neq c f_X(A) \text{ no homogeneity}$$

therefore,  $f_X$  is not linear
